

## Functional Description

The LCX257 is a quad 2-input multiplexer with 3-STATE outputs. It selects four bits of data from two sources under control of a Common Data Select input. When the Select input is LOW, the $\mathrm{I}_{0 x}$ inputs are selected and when Select is HIGH, the $I_{1 x}$ inputs are selected. The data on the selected inputs appears at the outputs in true (noninverted) form. The device is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input. The logic equations for the outputs are shown below:

$$
\begin{aligned}
& \mathrm{Z}_{\mathrm{a}}=\overline{\mathrm{OE}} \cdot\left(1_{1 \mathrm{a}} \cdot \mathrm{~S}+\mathrm{I}_{\mathrm{Oa}} \cdot \overline{\mathrm{~S}}\right) \\
& \mathrm{Z}_{\mathrm{b}}=\overline{\mathrm{OE}} \cdot\left(1_{1 \mathrm{~b}} \cdot \mathrm{~S}+\mathrm{I}_{\mathrm{ob}} \cdot \overline{\mathrm{~S}}\right) \\
& \mathrm{Z}_{\mathrm{c}}=\overline{\mathrm{OE}} \cdot\left(1_{1 \mathrm{c}} \cdot \mathrm{~S}+\mathrm{I}_{\mathrm{Oc}} \cdot \overline{\mathrm{~S}}\right) \\
& \mathrm{Z}_{\mathrm{d}}=\overline{\mathrm{OE}} \cdot\left(1_{1 \mathrm{~d}} \cdot \mathrm{~S}+\mathrm{I}_{\mathrm{Od}} \cdot \overline{\mathrm{~S}}\right)
\end{aligned}
$$

When the Output Enable ( $\overline{\mathrm{OE}}$ ) is HIGH, the outputs are forced to a high impedance state. If the outputs are tied together, all but one device must be in the high impedance state to avoid high currents that would exceed the maximum ratings. Designers should ensure the Output Enable signals to 3-STATE devices whose outputs are tied together are designed so there is no overlap.

Recommended Operating Conditions (Note 3)

Note 1: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating
Conditions" table will define the conditions for actual device operation.
Note 2: $I_{0}$ Absolute Maximum Rating must be observed
Note 3: Unused inputs must be held HIGH or LOW. They may not float.
