## 9341 <br> 93L41 <br> 93541 <br> 4-BIT ARITHMETIC LOGIC UNIT

DESCRIPTION-The '41 4-bit arithmetic logic units can perform all the possible 16 logic operations on two variables and a variety of arithmetic operations; the Add and Subtract modes are the most important. The ' 41 is a pin replacement for the 54/74181.

- PROVIDE 16 OPERATIONS ADD, SUBTRACT, COMPARE, DOUBLE TWELVE OTHER ARITHMETIC OPERATIONS
- PROVIDE ALL 16 LOGIC OPERATIONS OF TWO VARIABLES EXCLUSIVE-OR, COMPARE, AND NAND, OR, NOR, PLUS TEN OTHER LOGIC OPERATIONS

ORDERING CODE: See Section 9

[^0]FUNCTIONAL DESCRIPTION - The '41 is a 4-bit high speed parallel arithmetic logic unit (ALU). Controlled by the four Function Select inputs ( $\mathrm{S}_{0}-\mathrm{S}_{3}$ ) and the Mode Control input (M), it can perform all the 16 possible operations or 16 different arithmetic operations on active HIGH or active LOW operands. The Function Table below lists these operations.

When the Mode Control input (M) is HIGH, all internal carries are inhibited and the device performs logic operations on the individual bits as listed. When the Mode Control input is LOW, the carries are enabled and the device performs arithmetic operations on the two 4-bit words. The device incorporates full internal carry lookahead and provides for either ripple carry between devices using the $\mathrm{C}_{\mathrm{n}}+4$ output, or for carry lookahead betweeen packages using the signals $\overline{\mathrm{P}}$ (Carry Propagate) and $\overline{\mathrm{G}}$ (Carry Generate). $\overline{\mathrm{P}}$ and $\overline{\mathrm{G}}$ are not affected by carry in. When speed requirements are not stringent, the ' 41 can be used in a simple ripple carry mode by connecting the Carry output $\left(C_{n}+4\right)$ signal to the Carry input ( $C_{n}$ ) of the next unit. For super high speed operation the Schottky ' 41 should be used in conjunction with the ' 42 carry lookahead circuit.

The A = B output from the ' 41 goes HIGH when all four $\bar{F}_{n}$ outputs are HIGH and can be used to indicate logic equivalence over four bits when the unit is in the subtract mode. The $A=B$ output is open-collector and can be wired-AND with the other $A=B$ outputs to give a comparison for more than four bits. The $A=B$ signal can also be used with the $C_{n+4}$ signal to indicate $A>B$ and $A<B$.

The Function Table lists the arithmetic operations that are performed without a carry in. An incoming carry adds a one to each operation. Thus select code LHHL generates A minus B minus 1 (2s complement notation) without a carry in and generates A minus B when a carry is applied. Because subtraction is actually performed by complementary addition (1s complement), a carry out means borrow; thus a carry is generated when there is no underflow and no carry is generated when there is underflow.

As indicated the '41 can be used with either active LOW inputs producing active LOW outputs or with active HIGH inputs producing active HIGH outputs. For either case the table lists the operations that are performed to the operands labled inside the logic symbol.

[^0]:    OC-Open Collector

[^1]:    -Each bit is shifted to the next more significant position

    - Arithmetic operations expressed in 2 s complement notation

    H = HIGH Voltage Level
    L = LOW Voltage Level
