

# **CCD Delay Line for Multi-System**

#### Overview

The LC89978M is a CCD delay line for multi television system that incorporates a comb filter to remove noise from the chrominance signal and a 1-H delay line for the luminance signal.

#### **Features**

- 5-V single-voltage power supply
- Built-in 4 × PLL frequency multiplier circuit allows 4fsc operation from an fsc (3.58 MHz) input.
- Can be switched between the NTSC/M, PAL/GBI, and PAL/M formats by setting control pin values.
- Includes a built-in crosstalk exclusion comb filter for the chrominance signal that provides high-precision comb characteristics in an adjustment-free circuit.
- Peripheral circuits provided on chip for operation with a minimum of external components.
- Positive-phase signal input, positive-phase signal output (luminance signal)

#### **Functions**

- CCD shift registers (for chrominance and luminance signals)
- Timing generator and clock driver for CCD
- Delay time selective circuit
- · CCD signal adder
- · Auto-bias circuit
- Sync tip clamp circuit (luminance signal)
- Center bias circuit (chrominance signal)
- · Sample-and-hold circuit
- 4 × PLL frequency multiplier circuit
- · 4fsc clock output circuit
- High voltage generator for CCD Reset Drain (RD).

# **Specifications**

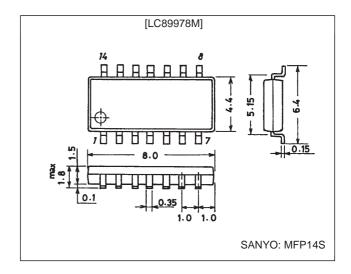

Absolute Maximum Ratings at  $Ta = 25^{\circ}C$ 

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	$V_{DD}$		-0.3 to +6.0	V
Allowable power dissipation	Pd max		250	mW
Operating temperature	Topr		-10 to +60	°C
Storage temperature	Tstg		-55 to +125	°C

# **Package Dimensions**

unit: mm

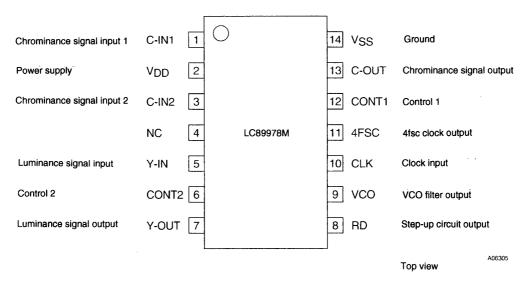

#### 3111-MFP14S

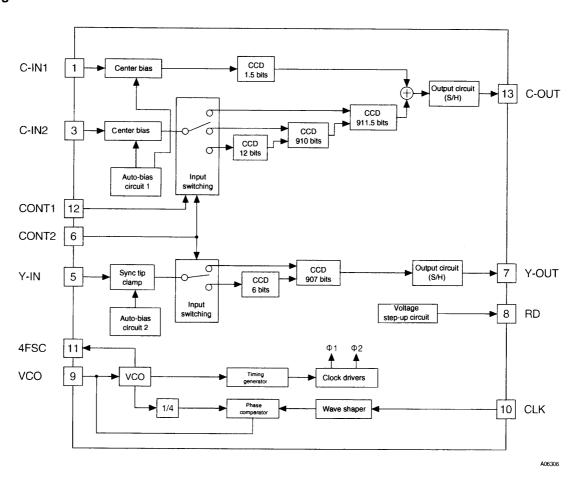

# Allowable Operating Ranges at $Ta = 25^{\circ}C$

Parameter	Symbol	Conditions		Unit			
Parameter	Symbol	Conditions	min	typ	max		
Supply voltage	V <sub>DD</sub>		4.75	5.00	5.25	V	
Clock input amplitude	V <sub>CLK</sub>		300	500	1000	mVp-p	
Clock frequency	F <sub>CLK</sub>	Sine wave		3.579545		MHz	
Chrominance signal input amplitude	V <sub>IN-C</sub>			350	500	mVp-p	
Luminance signal input amplitude	V <sub>IN-Y</sub>		·	400	572	mVp-p	

# **Pin Assignment**

## **Block Diagram**

## **Control Pin Functions**

CONT1	CONT2	Mode (representative)	Chrominance signal delay (number of CCD stages)	Luminance signal delay (number of CCD stages)
Low	Low	PAL/GBI	2H (1833.5) + 0H (1.5)	1H (913)
Low	High	PAL/M	2H (1821.5) + 0H (1.5)	1H (907)
High	Low	_	_	_
High	High	NTSC/M	1H (911.5) + 0H (1.5)	1H (907)

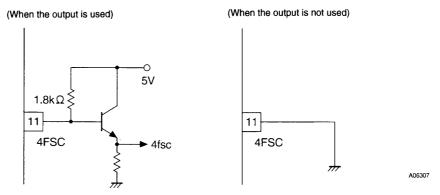

## **Switching Voltage Levels**

Parameter Syr	Symbol	Conditions		Unit		
	Symbol	Conditions	min	typ	max	Offic
Switching voltage level: low	VL		-0.3	0.0	+0.5	V
Switching voltage level: high	V <sub>H</sub>		2.0	5.0	6.0	V

Note: \*Since the control pins have built-in pull-down resistors (about 70 k $\Omega$ ), leaving these pins opens effectively sets them to the low level.

#### **Function of the 4FSC Pin**

This pin provides a 4fsc clock signal generated by the 4 × PLL frequency multiplier circuit.

Electrical Characteristics at  $V_{DD}$  = 5.0 V, Ta = 25°C,  $F_{CLK}$  = 3.579545 MHz,  $V_{CLK}$  = 500 mVp-p

#### **Test Conditions**

- 1. The supply current with no input signal
- 2. The pin output voltage (the center bias voltage) with no input signal
- 3. Measure the C-OUT output when a 350-mVp-p sine wave is input to C-IN1 and C-IN2.

$$G_{VC} = 20log \frac{C\text{-OUT output }[mVp\text{-}p]}{350 [mVp\text{-}p]} [dB]$$

Test frequencies:

 $G_{VC-1}$ : 4.431395 MHz (PAL/GBI)  $G_{VC-2}$ : 3.571628 MHz (PAL/M)  $G_{VC-3}$ : 3.571628 MHz (NTSC/M)

4. Measure the comb depth from the C-OUT output when a 350-mVp-p sine wave with frequency fa is input to C-IN1 and C-IN2, and when a sine wave of frequency fb is input.

$$C_D = 20log \ \frac{\text{The C-OUT output for an fb input } [\text{mVp-p}]}{\text{The C-OUT output for an fa input } [\text{mVp-p}]} \ [\text{dB}]$$

Test Frequencies

$$\begin{array}{ccc} & & & \text{fb} \\ \text{$C_{D\text{-}1}$: 4.431395 MHz (PAL/GBI)} & & 4.435303 \text{ (PAL/GBI)} \\ \text{$G_{D\text{-}2}$: 3.571628 MHz (PAL/M)} & & 3.575561 \text{ (PAL/M)} \\ \text{$G_{D\text{-}3}$: 3.571628 MHz (NTSC/M)} & & 3.563761 \text{ (NTSC/M)} \end{array}$$

5. Measure the C-OUT output when a 200-mVp-p sine wave is input to C-IN1 and C-IN2, and when a 500-mVp-p sine wave is input, and calculate the gain difference as follows:

$$L_{NC} = 20 log \left( \frac{The \ output \ for \ a \ 500 \text{-mVp-p input } [\text{mVp-p}]}{500 \ [\text{mVp-p}]} \middle/ \frac{The \ output \ for \ a \ 200 \text{-mVp-p input } [\text{mVp-p}]}{200 \ [\text{mVp-p}]} \right) [dB]$$

**Test Frequencies** 

 $\begin{array}{ll} L_{NC\text{-}1} & 4.431395 \text{MHz} \ (PAL/GBI) \\ L_{NC\text{-}2} & 3.571628 \text{MHz} \ (PAL/M) \\ L_{NC\text{-}3} & 3.571628 \text{MHz} \ (NTSC/M) \end{array}$ 

- 6. Measure the 4fsc (14.3 MHz) and fsc (3.58 MHz) components in the C-OUT output with no input signal.
- 7. Measure the noise in the C-OUT output with no input signal.

Measure the noise with a noise meter with a 200-kHz high-pass filter and a 5-MHz low-pass filter.

8. Input a 350-mVp-p sine wave to C-IN1 and C-IN2. Let V1 be the C-OUT output when SW3 is set to the 'a' position, and let V2 be the C-OUT output when SW3 is set to the 'b' position.

$$Z_{OC} = \frac{V2 [mVp-p] - V1 [mVp-p]}{V1 [mVp-p]} \times 500 [dB]$$

**Test Frequencies** 

 $Z_{OC-1}$ : 4.431395 MHz (PAL/GBI)  $Z_{OC-2}$ : 3.571628 MHz (PAL/M)  $Z_{OC-3}$ : 3.571628 MHz (NTSC/M)

- 9. The delay time in the C-OUT output with respect to the C-IN1 input. This is the CCD 1.5-bit delay.
- 10. The pin output voltage (clamp voltage) with no input signal.

11. Measure the Y-OUT output with a 200-kHz 400-mVp-p sine wave input to Y-IN.

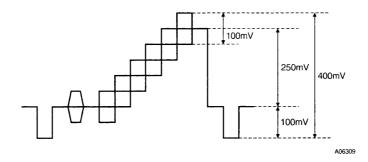

$$G_{VY} = 20log \ \frac{Y\text{-OUT output }[mVp\text{-}p]}{400 \ [mVp\text{-}p]} \ [dB]$$

12. Measure the Y-OUT output when a 200-kHz 200-mVp-p sine wave is input to Y-IN, and when a 3.5-MHz 200-mVp-p sine wave is input.

$$G_{FY} = 20log \frac{\text{The Y-OUT output for a 3.5-MHz input [mVp-p]}}{\text{The Y-OUT output for a 200-kHz input [mVp-p]}} [dB]$$

Here, adjust Vbias so that the clamp level is +250 mV.

13. Apply a 5-step staircase wave (as in the figure below) to Y-IN, and measure the differential gain and differential phase in the Y-OUT output using a vector scope.

14. Apply a 5-step staircase wave (as in the figure below) to Y-IN, and measure the luminance level (Y) and the sync level (S) in the Y-OUT output.

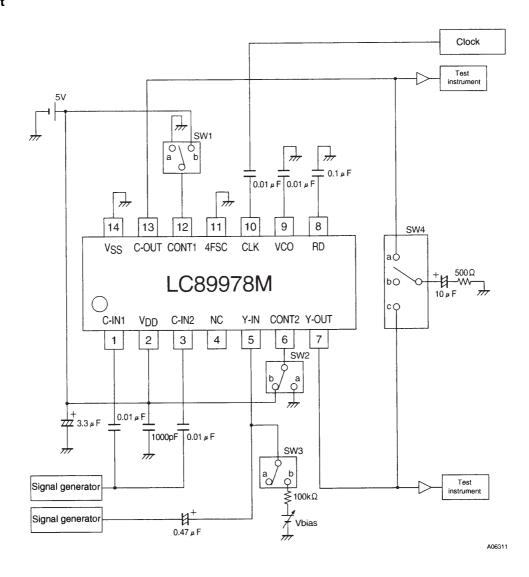

$$L_{S} = \frac{S \text{ [mV]}}{Y \text{ [mV]}} \times 100 \text{ [\%]}$$

- 15. Measure the 4fsc (14.3 MHz) and fsc (3.58 MHz) components in the Y-OUT output with no input signal.
- 16. Measure the noise in the Y-OUT output with no input signal.
  Measure the noise with a noise meter with a 200-kHz low-pass filter, a 4.2-MHz low-pass filter, and a 3.58-MHz trap filter.
- 17. Input a 200-kHz, 400-mVp-p sine wave to Y-IN1. Let V1 be the V-OUT output when SW3 is set to the 'c' position, and let V2 be the Y-OUT output when SW3 is set to the 'b' position.

$$Z_{OY} = \frac{V2 [mVp-p] - V1 [mVp-p]}{V1 [mVp-p]} \times 500 [\Omega]$$

18. Measure the delay time in the Y-OUT output with respect to the input to Y-IN.
