SPECIFICATIONS

1) GENERAL

Frequency coverage	DJ-396KR : TX 368.5 ~ 399.5MHz RX 368.5 ~ 399.5MHz TA : TX 330 ~ 399.995MHz RX 330 ~ 399.995MHz
Mode	F3E (FM)
Channel steps	5,10,12.5,15,20,25, & 30kHz
Memory channels	160 channels+1 CALL channel
Antenna connector	TNC (50Ω unbalanced)
Frequency stability	±3 ppm
Microphone input impedance	2kΩ nominal
Power supply requirement	6.0 ~ 16.0V DC (negative ground)
Current drain (at 13.8 V DC)	1.3A (typical) Transmit high at 4.8W 200mA (typical) Receive at 500mW 50mA (typical) standby 20mA (typical) Battery save on
Usable temperature range	-10 ~ +60°C (14 ~ 140°F)
Dimensions	56 (W) × 124 (H) × 37 (D) mm (with EBP-50N) 2.2"(W) × 4.88"(H) × 1.45"(D) inches (with EBP-50N)
(Projections not included)	
Weight	Approx. 310g (10.9oz) (with EBP-50N)
DTMF (DJ-496)	16 Buttons Keypad
Sub audible Tone(CTCSS)	encoder/decoder installed (39tones)
Sub audible Tone (DCS)	encoder/decoder installed (104codes)

2) TRANSMITTER

Output power	Approx. 4W EBP-50N installed Approx. 4.8W 13.8V DC Approx. 0.8W (LOW)
Modulation system	Variable reactance frequency modulation
Spurious emissions	Less than -60dB
Max. frequency deviation	±5kHz

3) RECEIVER

Receive system	Double conversion superheterodyne
Intermediate frequencies	1st 30.85MHz / 2nd 455kHz
Sensitivity(12dB SINAD)	Less than -12.0dB μ (0.25V) (368.5 ~ 399.5MHz)
Selectivity	-6dB : 12kHz or more -60dB : 26kHz or less
Audio output power	500mW (typical with an 8Ω load) 450mW (8Ω 10% THD)

CIRCUIT DESCRIPTION

1) Receiver System

The receiver system is a double superheterodyne system with a 30.85MHz first IF and a 455kHz second IF.

1. Front End

The received signal at any frequency in the range is passed through the low-pass filter (L2, L3, L8, C2, C9, C10, C11, and C62) and high-pass filter (C56, C57, C61, L25 and D15), and amplified by the RF amplifier (Q9). The signal from Q9 is then passed through the tuning circuit (L19, L20, L21 and varicaps D12, D13 and D14) and converted into 30.85MHz by the mixer (Q10). The tuning circuit, which consists of L15, L19, L20, L21, D15, D12, D13 and D14 is controlled by the tracking voltage from the CPU so that it is optimized for the reception frequency. The local signal from the VCO is passed through the buffer (Q11), and supplied to the source of the mixer (Q10). The radio uses the lower side of the superheterodyne system.

2. IF Circuit

The mixer mixes the received signal with the local signal to obtain the sum of and difference between them. The crystal filter (XF1) selects 30.85MHz frequency from the results and eliminates the signals of the unwanted frequencies. The first IF amplifier (Q8) then amplifies the signal of the selected frequency.

3. Demodulator Circuit

After the signal is amplified by the first IF amplifier (Q8), it is input to pin 16 of the demodulator IC (IC4). The second local signal of 30.395MHz, which is oscillated by the internal oscillation circuit in IC4 and crystal (X2). Then, these two signals are mixed by the internal mixer in IC4 and the result is converted into the second IF signal with a frequency of 455kHz. The second IF signal is output from pin 3 of IC4 to the ceramic filter (FL1), where the unwanted frequency band of that signal is eliminated, and the resulting signal is sent back to the IC4 through pin 5.

The second IF signal input via pin 5 is demodulated by the internal limiter amplifier and quadrature detection circuit in IC4, and output as an audio signal through pin 10.

4. Audio Circuit

The audio signal from pin 10 of IC4 is compensated to the audio frequency characteristics in the de-emphasis circuit (R106, R107, C128, C127) and amplified by the AF amplifier (Q27). The signal is then input to pin 2 of the electronic volume (IC6) for volume adjustment, and output from pin 1. The adjusted signal is sent to the audio power amplifier (IC5) through pin 2 to drive the speaker.

5. Squelch Circuit

The signal except for the noise component in AF signal of IC4 is cut by the active filter inside IC. The noise component is amplified and rectified, then converted to the DC voltage to output from pin13 of IC4. The voltage is led to pin 2 of CPU and compared with the setting voltage. The squelch will open if the input voltage is lower than the setting voltage.

2) Transmitter System

1. Modulator Circuit

The audio signal is converted to an electric signal in either the internal or external microphone, and input to the microphone amplifier (IC8). IC8 consists of two operational amplifiers; one amplifier (pins 5, 6, and 7) is composed of pre-emphasis and IDC circuits and the other (pins 1, 2, and 3) is composed of a splatter filter. The maximum frequency deviation is obtained by VR1 and input to the cathode of the varicap of the VCO, to change the electric capacity in the oscillation circuit. This produces the frequency modulation.

2. Power Amplifier Circuit

The transmitted signal is oscillated by the VCO, amplified by the pre-drive IC (IC1) and drive amplifier (Q4), and input to the final amplifier (Q2). The signal is then amplified by the final amplifier (Q2) and led to the antenna switch (D2) and low-pass filter (L5, L3, L2, C24, C11, C10, and C9), where unwanted high harmonic waves are reduced as needed, and the resulting signal is supplied to the antenna.

3. APC Circuit

Part of the transmission power from the low-pass filter is detected by D7, converted to DC, and then amplified by a differential amplifier. The output voltage controls the bias voltage from the source of Q2 and Q4 to maintain the transmission power constant.

3) PLL Synthesizer Circuit

1. PLL

The dividing ratio is obtained by sending data from the CPU (IC9) to pin 2 and sending clock pulses to pin 3 of the PLL IC (IC2). The oscillated signal from the VCO is amplified by the buffer (Q5, Q37) and input to pin 6 of IC2. Each programmable divider in IC2 divides the frequency of the input signal by N according to the frequency data, to generate a comparison frequency of 5 or 6.25kHz.

2. Reference Frequency Circuit

The reference frequency appropriate for the channel steps is obtained by dividing the 21.25MHz reference oscillation (X1) by 4250 or 3400, according to the data from the CPU (IC9). When the resulting frequency is 5kHz, channel steps of 5, 10, 15, 20, 25, 30, and 50kHz are used. When it is 6.25kHz, the 12.5kHz channel step is used.

3. Phase Comparator Circuit

The PLL (IC2) uses the reference frequency, 5 or 6.25kHz. The phase comparator in the IC2 compares the phase of the frequency from the VCO with that of the comparison frequency, 5 or 6.25kHz, which is obtained by the internal divider in IC2.

4. PLL Loop Filter Circuit

If a phase difference is found in the phase comparison between the reference frequency and VCO output frequency, the charge pump output (pin 8) of IC2 generates a pulse signal, which is converted to DC voltage by the PLL loop filter and input to the varicap of the VCO unit for oscillation frequency control.

5. VCO Circuit

A Colpitts oscillation circuit driven by Q3 directly oscillates the desired frequency. The frequency control voltage determined in the CPU (IC9) and PLL circuit is input to the varicaps (D3, D29). This change the oscillation frequency, which is amplified by the VCO buffer (Q5) and output from the VCO unit.

4) CPU and Peripheral Circuits

1. LCD Display Circuit

The CPU turns ON the LCD via segment and common terminals with 1/4 the duty and 1/4 the bias, at the frame frequency is 112.5Hz.

2. Display Lamp Circuit

When the LAMP key is pressed, "H" is output form pin 42 of CPU (IC9) to the bases of Q19, Q24 and Q25.

3. Reset and Backup

When the power form the DC jack or external battery increases from Circuits 0 V to 2.5V or more, "H" level reset signal is output from the reset IC (IC11) to pin 33 of the CPU (IC9), causing the CPU to reset. The reset signal, however, waits at 100, and does not enter the CPU until the CPU clock (X3) has stabilized.

4. S(Signal) Meter Circuit

The DC potential of pin 8 of IC4 is input to pin 1 of the CPU (IC9), converted from an analog to a digital signal, and displayed as the S-meter signal on the LCD.

5. DTMF Encoder

The CPU (IC9) is equipped with an internal DTMF encoder. The DTMF signal is output from pin 10, through R179 and R180 (for level adjustment), and then through the microphone amplifier (IC8), and is sent to the varicap of the VCO for modulation. At the same time, the monitoring tone passes through the AF circuit and is output from the speaker.

6. CTCSS Encoder

The CPU (IC9) is equipped with an internal tone encoder. The tone signal (67.0 to 250.3 Hz) is output from pin 9 of the CPU to the varicap (D4) of the VCO for modulation.

7. DCS Encoder

The CPU (IC9) is equipped with an internal DCS code encoder. The code (023 to 754) is output from pin 9 of the CPU to the varicap (D16) of the PLL reference oscillator. When DCS is ON, DCS MUTE circuit (Q12-ON, Q18-ON, Q15-OFF) works. The modulation activates in X1 side only.

8. CTCSS, DCS Decoder

The voice band of the AF output signal from pin 10 of IC4 is cut by sharp active filter IC7 (VCVS) and amplified, then led to pin 4 of CPU. The input signal is compared with the programmed tone frequency code in the CPU. The squelch will open when they match.

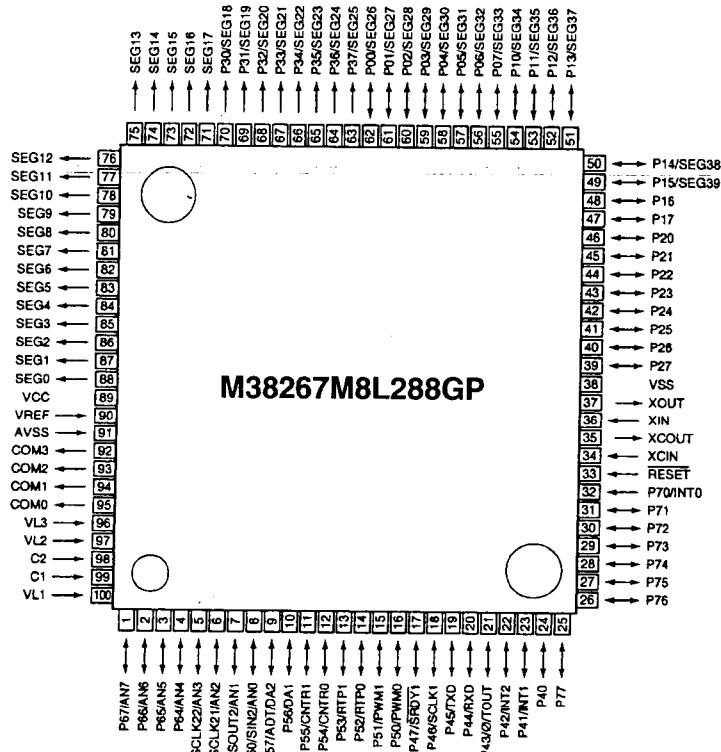

9. Clock Shift

In the unlikely event that CPU clock noise is present on a particular operating frequency programmed into the radio, you can shift the CPU clock frequency to avoid the CPU clock-noise. The output signal from pin 31 of the CPU turns on Q35. Then the oscillation frequency of X3 will be shifted about 300 ppm.

Packing Parts

ADJUSTMENT

1) Required Test Equipment

The following items are required to adjust radio parameters:

1. Regulated power supply

Supply voltage: 5-14V DC
Current: 3A or more

2. Digital multimeter

Voltage range: FS = Approx. 20V
Current: 10A or more
Input resistance: High impedance

3. Oscilloscope

Measurable frequency: Audio frequency

4. Audio dummy load

Impedance: 8Ω
Dissipation: 1W or more
Jack: 3.5mmφ

5. SSG

Output frequency: 500MHz or more
Output level: -20dBu/0.1uV -120dBu/1V
Modulation: AM/FM

6. Spectrum Analyzer

Measuring range: Up to 2GHz or more

7. Power meter

Measurable frequency: Up to 500MHz
Impedance: 50Ω, unbalanced
Measuring range: 0.1W -10W

8. Audio volmeter

Measurable frequency: Up to 100kHz
Sensitivity: 1mV to 10V

9. Audio generator

Output frequency: 67Hz to 10kHz
Output impedance: 600Ω, unbalanced

10. Distortion meter/SINAD meter

Measurable frequency: 1kHz
Input level: Up to 40dB
Distortion: 1% - 100%

11. Frequency counter

Measurable frequency: Up to 500MHz
Measurable stability: Approx. +/-0.1ppm

12.Linear detector

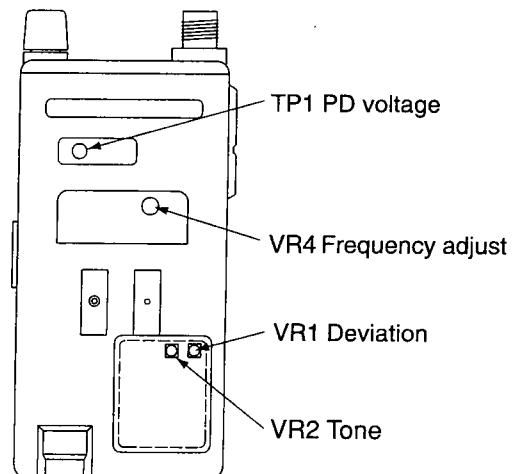

Measurable frequency: Up to 500MHz
Characteristics: Flat
CN: 60dB or more

Note

- Standard modulation: 1kHz +/-3.5kHz/DEV
- Reference sensitivity: 12dB SINAD
- Specified audio output level: 500mW at 8Ω
- Standard audio output level: 50mW at 8Ω
- Use an RF cable (3D2W:1m) for test equipment.
- Attach a fuse to the RF test equipment.
- All SSG outputs are indicated by EMF.
- Supply voltage for the transceiver: 13.8VDC

2) Adjustment Mode

The DJ-396 does not require a serviceperson to manipulate the components on the printed-circuit board, except the trimmer when adjusting reference frequency and deviation. Most of the adjustments for the transceiver are made by using the keys on it while the unit is in the adjustment mode. Because the adjustment mode temporarily uses the channels, frequency must be set on each channel before adjustments can be made. For instructions on how to program the channels, see the "DJ-396 INSTRUCTION MANUAL" which came with the product. In consideration of the radio environment, the frequency on each channel must be near the value (+/-1MHz) listed in the table below. To enter the adjustment mode, set key lock and input 490217. Decimal point at 100MHz and 10MHz appears in LCD. (To release the mode, same manner to enter the adjustment mode.)

Channel frequencies used in the adjustment mode

Memory Channel	Channel function	Frequency
		KR, TA
1	Reference frequency adjustment	384.05 MHz
2	High power adjustment	384.05 MHz
3	Low power adjustment	384.05 MHz
4	Minimum frequency sensitivity adjustment	368.5 MHz
5	Medium frequency sensitivity adjustment	384.05 MHz
6	Maximum frequency sensitivity adjustment	399.5 MHz
7	S-meter (1) adjustment	384.05 MHz
8	S-meter (FULL) adjustment	384.05 MHz
9	Deviation	384.05 MHz
10	DTMF (1) test (DJ-496)	384.05 MHz
11	DTMF (D) test (DJ-496)	384.05 MHz
13	Tone 88.5 Hz test	384.05 MHz
15	DCS code 255 test	384.05 MHz
16	Tone burst test	384.05 MHz
17	Aging (Not required to use)	384.05 MHz

Reference Frequency Adjustment

1. In the adjustment mode, select channel 1 by rotating the main tuning dial.
2. Press the **(PTT)** key to start transmission.
3. Rotate VR4 on the Main board until the value on the frequency counter matches the one displayed on the LCD.
4. (If the frequency display is flashing, the PLL is unlocked.)

High Power Adjustment

1. In the adjustment mode, select channel 2 by rotating the main tuning dial.
2. Hold down the **(FUNC)** key and press the H/L key to enter the high power mode. ("L" at the upper-left of the display disappears.)
3. Hold down the **(PTT)** key to start transmission.
4. While watching the reading of the TX power meter, set the output power to the value closest to 4.8 W by rotating the main tuning dial.
5. When the **(PTT)** key is released, the output power at that time will be stored as the high power setting.

Low Power Adjustment

1. In the adjustment mode, select channel 3 by rotating the main tuning dial.
2. Hold down the **(FUNC)** key and press the H/L key to enter the high power mode. ("L" appears at the upper-left of the display.)
3. Hold down the **(PTT)** key to start transmission.
4. While watching the reading of the TX power meter, set the output power to the value closest to 0.8 W by rotating the main tuning dial.
5. When the **(PTT)** key is released, the output power at that time will be stored as the low power setting.

Minimum Frequency Sensitivity Adjustment

See "Note on Adjusting the Sensitivity" later in this section.

1. In the adjustment mode, select channel 4 by rotating the main tuning dial.
2. Set the minimum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

Medium Frequency Sensitivity Adjustment

See Note on Adjusting the Sensitivity later in this section.

1. In the adjustment mode, select channel 5 by rotating the main tuning dial.
2. Set the medium frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

Maximum Frequency Sensitivity Adjustment

See "Note on Adjusting the Sensitivity" later in this section.

1. In the adjustment mode, select channel 6 by rotating the main tuning dial.
2. Set the maximum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key pressed.

S-meter (1) Adjustment

1. In the adjustment mode, select channel 7 by rotating the main tuning dial.
The S-meter will show a single circle (●)
2. Enter “0”dBu(EMF) with the transceiver tester (SSG).
3. Press the F key. The transceiver beeps indicating the new setting has been stored successfully.

S-meter (FULL)

1. In the adjustment mode, select channel 8 by rotating the main tuning dial.
The S-meter will show all six circles (●●●●●●)
2. Enter “+20”dBu (EMF) with the transceiver tester (SSG).
3. Press the F key. The transceiver beeps indicating the new setting has been stored successfully.

Deviation

1. In the adjustment mode, select channel 9 by rotating the main tuning dial.
2. Input a 50mVrms, 1KHz signal with your transceiver tester through the external microphone jack.
3. With the tester, put the transceiver in the transmission mode.
4. Rotate the VR1 on the printed-circuit board of the transceiver until the deviation is set to 4.5KHz.

DTMF (1) Test

This function is only for checking the DTMF code, not adjusting it.

1. In the adjustment mode, select channel 10 by rotating the main tuning dial.
2. Press the PTT key. DTMF code “1” is automatically sent and you will hear the monitoring tone from the speaker.
3. Check the deviation with the transceiver tester.

DTMF (D) Test

1. In the adjustment mode, select channel 11 by rotating the main tuning dial.
2. Press the PTT key. DTMF code “D” is automatically sent and you will hear the monitoring tone from the speaker.
3. Check the deviation with the transceiver tester.

Tone 88.5Hz

1. In the adjustment mode, select channel 13 by rotating the main tuning dial.
2. Press the PTT key. An 88.5Hz tone is automatically sent.
3. Rotate the VR2 on the printed-circuit board of the transceiver until the deviation is set to 0.9kHz (T) or 0.8kHz (E).

DCS Code 225 Test

1. In the adjustment mode, select channel 15 by rotating the main tuning dial.
2. Press the PTT key. An 255 DCS code is automatically sent.
3. Check the deviation with the transceiver tester.

Tone Burst Test

This function is only for checking the tone burst, not adjusting it.

1. In the adjustment mode, select channel 16 by rotating the main tuning dial.
2. Press the **(PTT)** key. An 1750Hz tone burst is automatically sent.
3. Check the deviation with the transceiver tester.

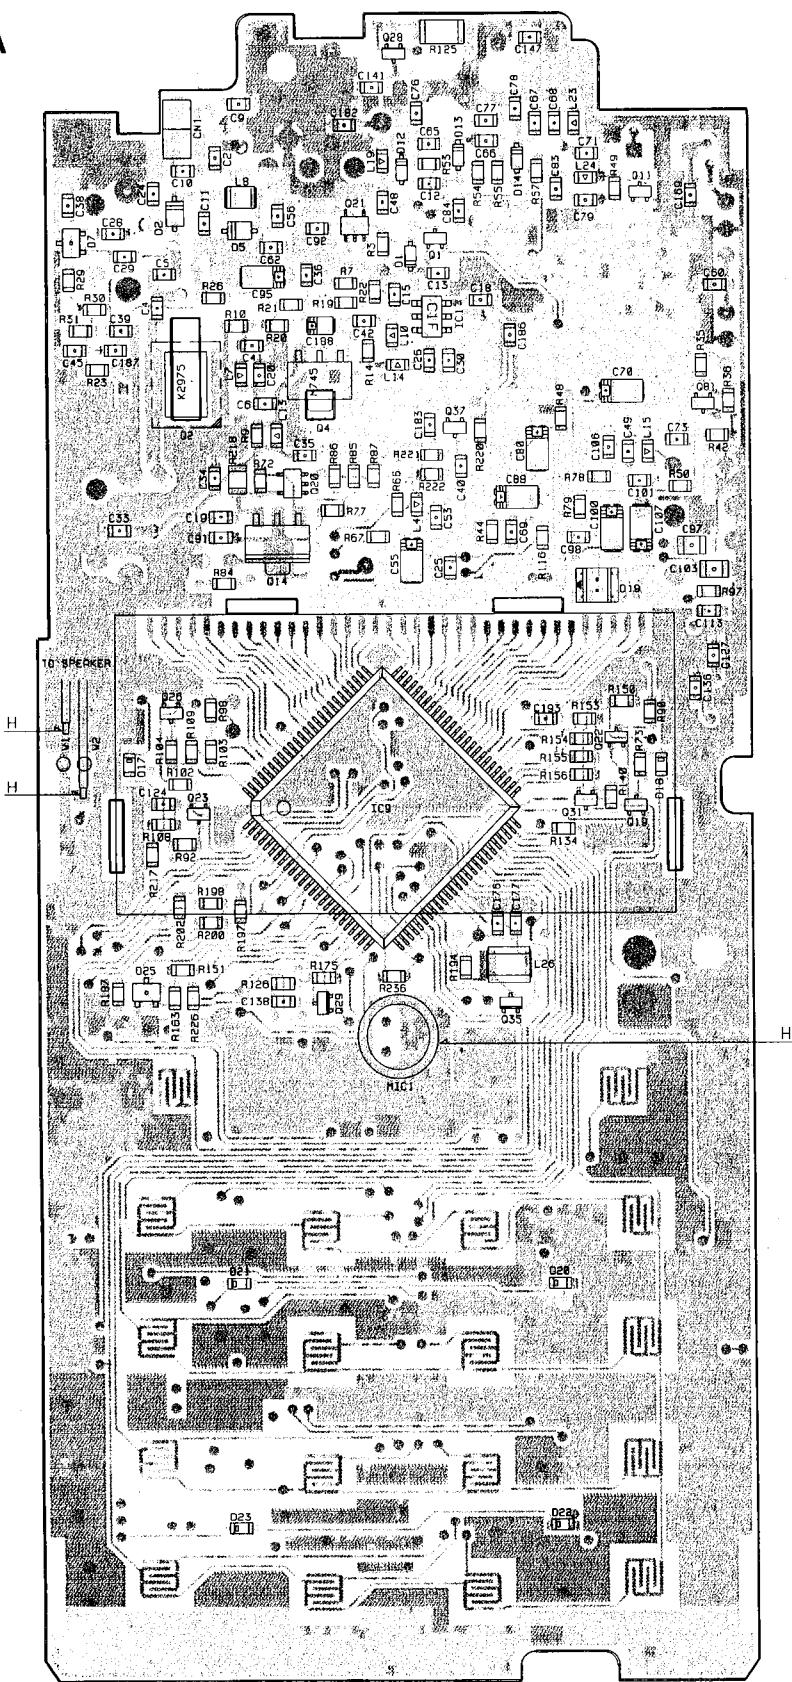

Aging

Perform this aging test only when necessary.

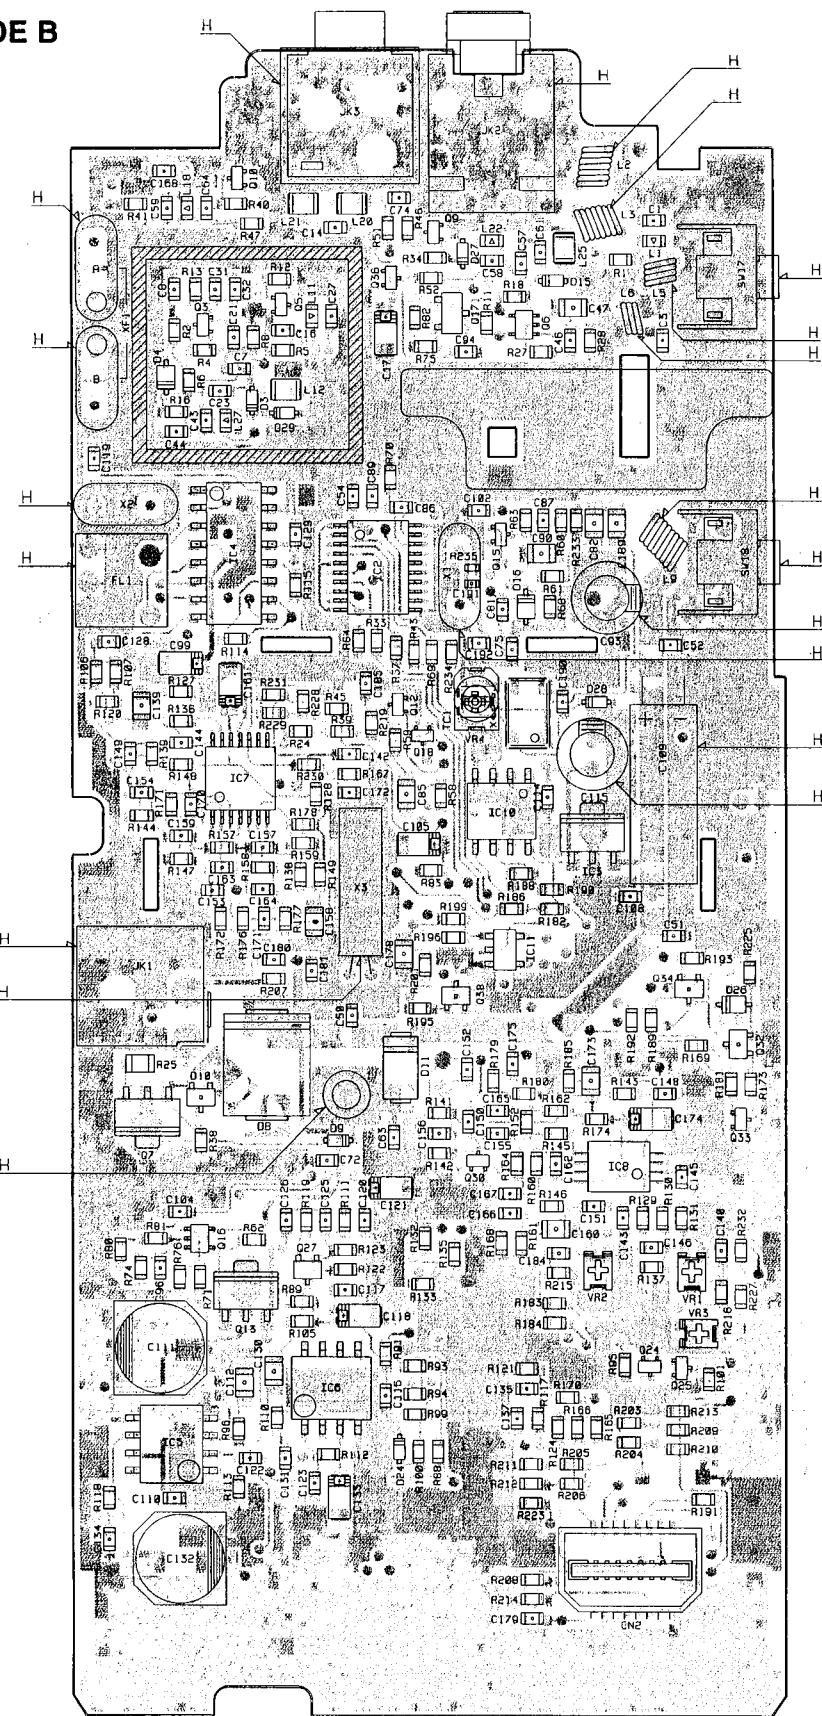

1. In the adjustment mode, select channel 17 by rotating the main tuning dial.
The transceiver automatically repeats transmission for a minute and reception for another minute.
